### Problem-2:

$\text{fib}(5) \rightarrow \text{fib}(4) \rightarrow \text{fib}(3) \rightarrow \text{fib}(2) \rightarrow \text{fib}(1) \rightarrow \text{fib}(0) \rightarrow \text{fib}(1) \rightarrow$   
 $\text{fib}(2) \rightarrow \text{fib}(1) \rightarrow \text{fib}(1) \rightarrow \text{fib}(0)$

### Problem-1:

#### ② Time Complexity:

$$3 + K + KN + K^2N + 2$$

$$5 + K + KN + K^2N$$

using limit function

$$\lim_{\substack{K \rightarrow \infty \\ N \rightarrow \infty}} 5 + K + KN + K^2N$$

$$\Rightarrow \lim_{\substack{K \rightarrow \infty \\ N \rightarrow \infty}} 1 + \frac{1}{K} + \frac{1}{KN} + \frac{5}{K^2N}$$

$\Rightarrow 1$  (a constant)

$$\therefore T(K^2N) = \Theta(K^2N)$$

- ③ By using min heap, I can improve the implementation. It's an optimized approach to sort the K arrays of N no. of elements by preserving their order.

### Problem-2:

#### ② Time complexity:

$$1 + 2N$$

$$\lim_{N \rightarrow \infty} 2 + \frac{1}{N} = 2 \text{ (a constant)}$$

$$\therefore T(N) = \Theta(N)$$

- ③ For removing duplicates the best <sup>time</sup> complexity is  $O(N)$ , we can optimize the code by reducing space complexity.
